All of the powers of "git flow" in a single package. For example, "git flow release" executes (roughly) the following commands: git flow release start --no-merge git flow release finish git flow feature start git flow feature finish git flow pull-request submit As you can see, this is essentially "git flow". "Git Town" seems very similar to "git flow", with one small exception -- the user interface does not look as slick as the UI of "git flow". What's the difference between Git Town and git flow? I do not know -- perhaps someone else on SO can tell. Perhaps the main difference is that git flow makes it easier to create your own branches, such as development branches, and other customizations. What if I want my branches to be similar to how they are in "git flow"? Even better -- what if I want my branches to be how they are in "git flow", except that my user interface (UI) looks like the UI of "git town"? And you will need to use "git town" to create your own branches, and other customizations. As a result, you will have to use "git town" instead of "git flow". Who is "Shinji97

I am new to Git and all I need is to do some basic things like moving files around in a repository and checking out different versions. I was looking for something that might not require too much time to get the hang of and have a friendly interface. After some research, I found GitBash and GitKraken both seem to be great for beginner. I am not much used to using command line, so it might not be easy. Is there any difference between these two? EDIT: I just found out about Git Town and I am a bit confused on which one to use? A: I am new to Git and all I need is to do some basic things like moving files around in a repository and checking out different versions. I was looking for something that might not require too much time to get the hang of and have a friendly interface. I would probably start with GitBash or GitKraken, especially GitKraken. After some research, I found GitBash and GitKraken both seem to be great for beginner. I am not much used to using command line, so it might not be easy. GitBash and GitKraken both require a cli. The key difference is that GitKraken is more git-centric. GitKraken does a lot more things than the traditional git command line (like fetching repos, etc.) and it does all of this by using web APIs. GitBash is just a bash-like command line that uses git CLI directly.
