Index.dat files are a small database that's created by Internet Explorer on a daily basis. The files are kept in the Windows registry so that the Internet Explorer browser can store various information about the website you visit and the pages you have already viewed. Although these files have become somewhat a synonym with privacy-focused software, it's important to understand that they aren't something to worry about or be wary of. Let's see how index.dat files are made and why they are needed: Every time you visit a new website, your Internet Explorer browser opens a window with the "URL address" of the page you are visiting. This window contains the website's name and your current IP address. Then, Internet Explorer opens a new "Back" window, so that you can go back to the previous website you have visited. When you click on the back arrow, Internet Explorer checks to see if the website you visited had an index.dat file associated with it. If the website you have visited did not have any index.dat file associated with it, Internet Explorer creates a blank database entry in the Windows registry. If the website you visited had an index.dat file, Internet Explorer uses the information from that file to associate it with your current IP address. This way, Internet Explorer will store the website name, the current IP address, and the file's creation date and size in the Windows registry. This way, the Internet Explorer browser will automatically store information about the websites you visit and your previous visits on a daily basis. More info:

After being extremely popular for a long time, KeyM* has been taken over by the good folk of Indego. KeyM* allows to bind macros to any keys of the keyboard or a mouse. It has four main modes: "PC" mode: the macro is assigned to the mouse. "Macro Hot Key" mode: the macro is assigned to a specific keyboard key. "System Events" mode: the macro is assigned to any key on the keyboard. "Frequent Keys" mode: the macro is assigned to a specific key on the keyboard, this key has a fixed position and its repetition is configurable. The macros have several parameters and the user is free to define them as he wants. For example, one can assign a key to act as the "repeat button" and assign a macro that opens a video clip when the button is pressed. The release button can also perform other functions such as to display a message on the screen. KeyM* is a real game changer. From the number of parameters that can be assigned to the key, to the possibility to define the delay between the press and the release of the key, the possibilities are infinite. Moreover, the program allows to assign a macro to an entire folder or even to a subfolder. This is really practical in the case of Windows users since it is much easier to do a one-shot operation that includes all the files inside the folder than to close and reopen the program each time. Another nice feature is the possibility to assign a different macro to a specific file, as long as the file is opened and the macro is available in the list of available macros. This is a highly useful function for users who often have to access or change a specific file and want to easily execute a macro to do so. All the features of the application have been fully optimized for maximum performance. Basically, this means that the program works flawlessly even with huge amounts of data stored in the system. KEYMACRO has been widely used and it has a great following in the community of users. It is now available in English, French, German, Spanish, Italian, Russian, Portuguese, Chinese and Japanese languages. The software's unique selling proposition is its extensive feature set that is focused on compatibility with almost all the types of hardware and OS available on the market. Enhancements to this software over the past 1d6a3396d6

Index.dat Scanner is a small application built with a single goal in mind: to help users scan the computer for Index.dat files. This way, they can verify if the browser records stored in these files have been actually deleted by previously used privacy-oriented tools. Since this is a portable program, it is important to mention that it doesn't leave any traces in the Windows Registry. You can copy it on any USB flash drive or other devices, and take it with you whenever you need to scan your computers for Index.dat files on the breeze. Index.dat Scanner sports a clean and simple interface that allows users to scan the computer or only the specified files. The scanning process doesn't take too much time and you can view the total number of records found at the end of the task. The application keeps a log with details about possible errors, and you can save it to a file. As it would be expected from such a small tool, it doesn't eat up CPU and memory, so it doesn't affect the overall performance of the PC, nor interfere with other programs' functionality. The lack of dedicated parameters could be good news only for the less experienced users that don't have to spend a lot of time configuring them or reading a help manual. All things considered, Index.dat Scanner is a simple software solution that helps you check the existence of Index.dat files in the computer, so it doesn't come packed with cleaning capabilities or advanced functions.

Friday, March 20, 2012 Highlights from SEC/ACC Media Days What a whirlwind it was on Tuesday and Wednesday in Columbia, SC! Here are some of the more interesting comments from the Southeastern and Atlantic Coast Conferences as reporters tried to make sense of all the roster changes and drama that had unfolded. A reminder for those who have forgotten, or have never followed the SEC, that the Southeastern Conference is the 16-member university conference that is part of the NCAA's Power Five conferences. Regarding Texas A&M and the NCAA: Commissioner Mike Slive: "We think there is a question of whether or not there is a model for the NCAA to look at and if there is, what do they see and what do they think is right. But what the NCAA has in mind right now is the old model. There is a question in how you deal with the current situation.
