XdN Tweaker Download

The program called XdN Tweaker allows you to remove unwanted features of the operating system. This tool was designed for Windows 7 but it can be used on Windows 8 as well. The interface of this program is somewhat simple. A simple window displays the status and the system information. Using the options available in this window, you can adjust the appearance of the system (icons, text fonts, etc.) or change the behavior of the program. It contains two interesting features: - Desktop Rules You can easily configure this feature to work with Windows 7. Windows 7 allows you to set custom file extensions to be associated with a certain program or even an application. If you select the extension with the "Browse..." button and choose "Windows" for the program that should be launched with the selected file, then the user will be prompted with a dialog box where he can choose what program he wants to run. After selecting the program, it will be launched automatically by the operating system. This feature is useful to send files directly to a specific application (e.g. Microsoft Excel). In the advanced configuration, you can select the type of extensions (e.g. an *.ext or *.exe file) or even set the path to a specific program (e.g. C:\Program Files\Sage\Excel.exe). - Windows Performance Options As you can see, the interface of XdN Tweaker is quite simple. However, this app can be quite useful in your routine: - Enable or disable the system services You can use the advanced configuration and allow or disallow the Windows services to run (if they run and are not important). - Control the mouse hover time This feature lets you set the timeout between the mouse entering the cursor (when it starts blinking) and the program closing. - Set the IE number of simultaneous connections to a server You can configure this option if you want to use more than one IE at the same time (e.g. for a software development project). XdN Tweaker is a simple to use application. The user interface of this tool is quite good. It does not require a lot of attention because of its simplicity. You can configure a lot of useful options in a short period of time. The program's response time is good. It took only a few seconds to load our test files and the changes have been made properly. However, Xd

What's New in the?

XdN Tweaker is a simple-to-use yet powerful program that allows you to make some modifications to your operating system. In order to work with this tool, you must have administrative rights. The interface of the app consists of a common window with a well-organized layout where you can view system information and launch the User Account Control (UAC) panel, for instance. So, you can change the appearance of your icons by applying the blank or XP style overlay, as well as remove the "Send To" and "Shortcut To" entries from the Explorer context menu and integrate the "Copy To Folder", "Move To Folder" and "Take Ownership" options. In addition, you can disable the autorun.inf file and regional Windows 7 themes, adjust the mouse hover timeout, remove the current user's program associations for the selected file extension, as well as set the number of simultaneous IE connections to a server, just to name a few. The program requires a moderate quantity of CPU and system memory, has a good response time and worked smoothly during our tests, without causing the operating system to freeze, crash or display error notifications; we have not come across any issues. On the other hand, many features available via XdN Tweaker can be found by default in the operating system; the app merely provides a shortcut to them (e.g. configure IE settings and Windows performance options). Nevertheless, XdN Tweaker provides some user-friendly features for making the operating system fit your preferences. Key features:

- Create custom cursors and control the color, size and position of the cursor as you want.
- Apply custom mouse cursors to specific icons, folder types or shortcuts.
- Enable/disable the scroll bars in all programs, you can customize the mouse pointer in various ways.
- Create custom mouse cursors and apply them to any shortcut, folder or program.
- Set keyboard layout and theme, create custom keyboard shortcuts, hide the windows title bar and control the window positioning.
- Install the Last resort software, eliminate notifications and lock files with restrictions.
- Set file properties, encrypt files, move files to another directory and remove the ownerships of files.
- Exclude file types, remove the selection of files and folders from the context menu.
- Generate a password for a file or folder.
- Remove the users from the computer or change their login password.
- Decrypt and encrypt files and folders, lock files and protect them with passwords.
- Change settings in Control Panel, application settings, Internet Explorer and Windows Explorer.
- Free up hard disk space, close unused processes and save data in Windows folders and files.
- Optimize the performance of
