Growth factor treatment of annular stage lymphangiogenesis with scatter factor for treatment of idiopathic pulmonary arterial hypertension. Annular lymphangiectasis and lymphatic remodeling contribute to the pathogenesis of idiopathic pulmonary arterial hypertension (IPAH) by a mechanism distinct from that of the alternative form of pulmonary hypertension. The aim was to test whether growth factor treatment of lymphangiogenesis, a cardinal lesion of IPAH, would prevent disease development in a mouse model of IPAH. In mice, a growth factor-producing adenovirus was used to determine whether intraperitoneal injection of vascular endothelial growth factor (VEGF) and scatter factor (SF) could attenuate vascular endothelial growth factor receptor (VEGFR)-2 expression in the pulmonary venous cuffs, a characteristic of IPAH. Pulmonary hypertension and right ventricular hypertrophy were measured. Hemodynamic studies also were performed to evaluate vascular reactivity. The growth factor-treated mice were compared with control animals. In the intraperitoneal growth factor-treated group, pulmonary vessels showed less VEGFR-2 expression, vascular remodeling, and pulmonary vascular reactivity were improved compared with controls. The intraperitoneal growth factor-treated mice showed less right ventricular hypertrophy and dilatation and less remodeling of the pulmonary vasculature. Intraperitoneal growth factor-treated mice had less right ventricular systolic pressure than controls, and their pulmonary hemodynamics were normalized. The intraperitoneal administration of VEGF and SF prevented development of vascular remodeling and pulmonary hypertension. VEGF and SF could have a therapeutic role in the treatment of pulmonary hypertension. Angiotensin II signaling in the vascular wall of the ovine cotyledonary artery: direct cellular evidence of involvement of the AT1-receptor and protein kinase C. We have examined the cellular sites of angiotensin II (AII) action in the ovine cotyledonary artery by use of a combination of immunohistochemistry and in vitro cell culture techniques. The subcellular distribution of the AT1-receptor in vascular smooth muscle (VS) and endothelial cells (EC) was determined in intact microvessels in situ by immunoperoxidase staining and in vitro by immunoblotting. Distribution of the AT1-receptor in VS was identical to that found in other vascular beds.

Photoshop supports an extremely wide variety of fonts. To find the correct one, start by double-clicking the typeface you want to use. Then, start typing the name of the font in the text tool and watch as Photoshop finds matches for you. The various colorization effects help you add color, style, or texture to your work. The Stroke effect lets you paint or draw on an area of an image. The Gradient options let you mask a color from one area of an image and spread it over another area. The Patch tool allows you to add or remove colors from an image, perfect for touching up photos or creating mosaics. Sometimes, you need a more sophisticated tool than the paintbrush. You can use the Text tool to outline text, create text boxes, and merge objects. The Lasso tool lets you select areas of an image or a text box and then edit the selected areas. Once selected, you can crop the area, move it, or change the size. You can also save the work in a file, copy it to the clipboard, or print it. The Pen tool is very versatile. You can draw or select an area, and then paint or edit it any way you want. After you paint, you can save your work and then use it in other projects.
